# Table of Contents

<b><u>Preface</u></b> .....	<b>1</b>
<u>System Overview</u> .....	1
<u>Document Overview</u> .....	2
<b><u>1 – Printing System Overview</u></b> .....	<b>3</b>
<u>The Printing Problem</u> .....	3
<u>The Technology</u> .....	4
<u>Jobs</u> .....	4
<u>Classes</u> .....	4
<u>Filters</u> .....	4
<u>Printer Drivers</u> .....	5
<u>Networking</u> .....	5
<b><u>2 – The CUPS API</u></b> .....	<b>7</b>
<u>The CUPS Library</u> .....	7
<u>Detecting the CUPS Library in Autoconf</u> .....	7
<u>Basic Services</u> .....	7
<u>Include Files</u> .....	7
<u>Getting the Available Printers and Classes</u> .....	7
<u>Printing Files</u> .....	8
<u>Setting Printer Options</u> .....	8
<u>Cancelling Jobs</u> .....	8
<u>HTTP Services</u> .....	8
<u>Include Files</u> .....	8
<u>Connecting to a Server</u> .....	8
<u>Setting Request Fields</u> .....	8
<u>Issuing a Request</u> .....	8
<u>Getting the Request Status</u> .....	8
<u>Sending Request Data</u> .....	8
<u>Reading Request Data</u> .....	8
<u>IPP Services</u> .....	8
<u>Include Files</u> .....	9
<u>Creating an IPP Request</u> .....	9
<u>Adding Attributes</u> .....	9
<u>Sending an IPP Request</u> .....	9
<u>Reading an IPP Response</u> .....	9
<u>Finding Attributes</u> .....	9
<u>Looping Through Attributes</u> .....	9
<u>IPP Standard Operations</u> .....	9
<u>IPP Extension Operations</u> .....	9
<u>CUPS Extension Operations</u> .....	9
<u>Language Services</u> .....	9
<u>Include Files</u> .....	9
<u>Getting the Default Language</u> .....	10
<u>Getting the Language Encoding</u> .....	10
<u>Getting a Language String</u> .....	10
<u>MIME Services</u> .....	10

# Table of Contents

<a href="#">Include Files</a> .....	10
<a href="#">Loading a MIME Database</a> .....	10
<a href="#">Finding a Specific MIME Type</a> .....	10
<a href="#">Finding the MIME Type of a File</a> .....	10
<a href="#">Filters</a> .....	10
PPD Services.....	10

# Preface

This software programmers manual provides software programming information for the Common UNIX Printing System ("CUPS") Version 1.0.

## System Overview

The Common UNIX Printing System provides a portable printing layer for UNIX® operating systems. It has been developed by Easy Software Products to promote a standard printing solution for all UNIX vendors and users. CUPS provides the System V and Berkeley command-line interfaces.

CUPS uses the Internet Printing Protocol (IETF-IPP) as the basis for managing print jobs and queues. The Line Printer Daemon (LPD, RFC1179), Server Message Block (SMB), and AppSocket protocols are also supported with reduced functionality.

CUPS adds network printer browsing and PostScript Printer Description ("PPD")-based printing options to support real world applications under UNIX.

CUPS also includes a customized version of GNU GhostScript (currently based off GNU GhostScript 4.03) and an image file RIP that can be used to support non-PostScript printers.

## Document Overview

This software administrators manual is organized into the following sections:

- 1 – Printing System Overview
- 2 – The CUPS API
- 3 – Writing Filters
- 4 – Writing Printer Drivers
- 5 – Writing Backends
- A – Constants
- B – Structures
- C – Functions

# 1 – Printing System Overview

This chapter provides an overview of how the Common UNIX Printing System works.

## The Printing Problem

For years *the printing problem* has plagued UNIX®. Unlike Microsoft® Windows® or MacOS, UNIX has no standard interface or system in place for supporting printers. Among the solutions previously available, the Berkeley and System V printing systems are the most prevalent.

These printing systems support line printers (text only) or PostScript printers (text and graphics), and with some coaxing they can be made to support a full range of printers and file formats. However, because each variant of the UNIX operating system uses a different printing system than the next, developing printer drivers for a wide range of printers is extremely difficult. That combined with the limited volume of customers for each UNIX variant has forced most printer vendors to give up supporting UNIX entirely.

The Common UNIX Printing System, or CUPS, is designed to eliminate *the printing problem*. One common printing system can be used by all UNIX variants to support the printing needs of users. Printer vendors can use its modular filter interface to develop a single driver program that supports a wide range of file formats with little or no effort. Since CUPS provides both the System V and Berkeley printing commands, users (and applications) can reap the benefits of this new technology with no changes.

## The Technology

CUPS is based upon an emerging Internet standard called the Internet Printing Protocol, or IPP. IPP has been embraced by dozens of printer and printer server manufacturers, and will be supported by the next Microsoft Windows operating system.

IPP defines a standard protocol for printing as well as managing print jobs and printer options like media size, resolution, and so forth. Like all IP-based protocols, IPP can be used locally or over the Internet to printers hundreds or thousands of miles away. Unlike other protocols, however, IPP also supports access control, authentication, and encryption, making it a much more secure printing solution than older ones.

IPP is layered on top of the Hyper-Text Transport Protocol, or HTTP, which is the basis of web servers on the Internet. This allows the user to view documentation and status information on a printer or server using their web browser.

CUPS provides a complete IPP/1.0-based printing system that provides Basic authentication and domain or IP-based access control. Digest authentication and TLS encryption will be available in future versions of CUPS.

## Jobs

Each file that is submitted for printing is called a *job*. Jobs are identified by a unique number starting at 1 and are assigned to a particular destination (usually a printer). Jobs can also have options associated with them such as media size, number of copies, and priority.

## Classes

CUPS supports collections of printers known as *classes*. Jobs sent to a class are forwarded to the first available printer in the class.

## Filters

Filters allow a user or application to print many types of files without extra effort. Print jobs sent to a CUPS server are filtered before sending them to a printer. Some filters convert job files to different formats that the printer can understand. Others perform page selection and ordering tasks. *Backend* filters perform the most important task of all – they send the filtered print data to the printer.

CUPS provides filters for printing many types of image files, HP-GL/2 files, PDF files, and text files. CUPS also supplies PostScript and image file Raster Image Processors, or RIPs, that convert PostScript or image files into bitmaps that can be sent to a raster printer.

CUPS provides backends for printing over parallel and serial ports, and over the network via the JetDirect (AppSocket), Server Message Block, and Line Printer Daemon protocols.

## Printer Drivers

Printer drivers in CUPS consist of one or more filters specific to a printer. CUPS includes a sample printer driver for Hewlett–Packard LaserJet and DeskJet printers. While this driver does not generate optimal output for different printer models, it does demonstrate how you can write your own printer drivers and incorporate them into CUPS.

## Networking

Printers and classes on the local system are automatically shared with other systems on the network. This allows you to setup one system to print to a printer and use this system as a printer server or spool host for all of the others. If there is only one occurrence of a printer on a network, then that printer can be accessed using its name alone. If more than one printer exists with the same name, users must select the printer by specifying which server to use (e.g. "printer@host1" or "printer@host2".)

CUPS also provides *implicit classes*, which are collections of printers and/or classes with the same name. This allows you to setup multiple servers pointing to the same physical network printer, for example, so that you aren't relying on a single system for printing. Because this also works with printer classes, you can setup multiple servers and printers and never worry about a "single point of failure" unless all of the printers and servers goes down!

## 2 – The CUPS API

This chapter describes the CUPS Application Programmers Interface ("API").

### **The CUPS Library**

#### **Detecting the CUPS Library in Autoconf**

#### **Basic Services**

#### **Include Files**

#### **Getting the Available Printers and Classes**

## **Printing Files**

### **Setting Printer Options**

### **Cancelling Jobs**

## **HTTP Services**

### **Include Files**

### **Connecting to a Server**

### **Setting Request Fields**

### **Issuing a Request**

### **Getting the Request Status**

### **Sending Request Data**

### **Reading Request Data**

## **IPP Services**

## **Include Files**

## **Creating an IPP Request**

## **Adding Attributes**

## **Sending an IPP Request**

## **Reading an IPP Response**

## **Finding Attributes**

## **Looping Through Attributes**

## **IPP Standard Operations**

## **IPP Extension Operations**

## **CUPS Extension Operations**

## **Language Services**

## **Include Files**

## **Getting the Default Language**

## **Getting the Language Encoding**

## **Getting a Language String**

## **MIME Services**

### **Include Files**

### **Loading a MIME Database**

### **Finding a Specific MIME Type**

### **Finding the MIME Type of a File**

### **Filters**

## **PPD Services**

### **Include Files**

### **Loading a PPD File**

## **Options and Groups**

### **Finding an Option**

### **Finding a Page Size**

### **Marking Options**

### **Checking for Conflicts**

### **Sending Options**

## 3 – Writing Filters

This chapter describes how to write a file filter for CUPS.

### **Overview**

### **Security Considerations**

Users and Groups

### **Temporary Files**

### **Page Accounting**

### **Command-Line Arguments**

## **Copy Generation**

## **Environment Variables**

## **Writing a HTML Filter**

## 4 – Writing Printer Drivers

This chapter discusses how to write a printer driver, which is a special filter program that converts CUPS raster data into the appropriate commands and data required for a printer.

### Overview

#### Page Accounting

#### Color Management

### Raster Functions

#### `cupsRasterOpen()`

**cupsRasterReadHeader()**

**cupsRasterReadPixels()**

**cupsRasterClose()**

**Writing a HP-PCL Driver**

# 5 – Writing Backends

This chapter describes how to write a backend for CUPS. Backends communicate directly with printers and allow printer drivers and filters to send data using any type of connection transparently.

## Overview

## Security Considerations

Users and Groups

## Temporary Files

## Page Accounting

## Retries

## **Command-Line Arguments**

### **Copy Generation**

### **Environment Variables**

### **Writing a Serial Port Backend**

# **A – Constants**

This appendix lists all of the constants that are defined by the CUPS API.

## **CUPS Constants**

## **HTTP Constants**

## **IPP Constants**

## **Language Constants**

## **MIME Constants**

## **PPD Constants**

## **Raster Constants**

## **B – Structures**

This appendix describes all of the structures that are defined by the CUPS API.

## C – Functions

This appendix provides a reference for all of the CUPS API functions.

# cupsAddOption()

## Usage

```
int
cupsAddOption(const char *name,
              const char *value,
              int num_options,
              cups_option_t **options);
```

## Arguments

Argument	Description
name	The name of the option.
value	The value of the option.
num_options	Number of options currently in the array.
options	Pointer to the options array.

## Returns

The new number of options.

## Description

cupsAddOption( ) adds an option to the specified array.

## Example

```
#include <cups.h>

...

/* Declare the options array */
int      num_options;
cups_option_t *options;

/* Initialize the options array */
num_options = 0;
options      = (cups_option_t *)0;

/* Add options using cupsAddOption() */
num_options = cupsAddOption("media", "letter", num_options, &options);
num_options = cupsAddOption("resolution", "300dpi", num_options, &options);
```

## See Also

[cupsFreeOptions\(\)](#), [cupsGetOption\(\)](#), [cupsParseOptions\(\)](#)

# cupsCancelJob()

## Usage

```
int  
cupsCancelJob(const char *dest,  
              int job);
```

## Arguments

Argument	Description
dest	Printer or class name
job	Job ID

## Returns

1 on success, 0 on failure. On failure the error can be found by calling [cupsLastError\(\)](#).

## Description

`cupsCancelJob()` cancels the specifies job.

## Example

```
#include <cups.h>  
  
cupsCancelJob("LaserJet", 1);
```

## See Also

[cupsLastError\(\)](#), [cupsPrintFile\(\)](#)

# cupsDoFileRequest()

## Usage

```
ipp_t *
cupsDoFileRequest(http_t *http,
                  ipp_t *request,
                  const char *resource,
                  const char *filename);
```

## Arguments

Argument	Description
http	HTTP connection to server.
request	IPP request data.
resource	HTTP resource name for POST.
filename	File to send with POST request (NULL pointer if none.)

## Returns

IPP response data or NULL if the request fails. On failure the error can be found by calling [cupsLastError\(\)](#).

## Description

`cupsDoFileRequest()` does a HTTP POST request and provides the IPP request and optionally the contents of a file to the IPP server. It also handles resubmitting the request and performing password authentication as needed.

## Example

```
#include <cups.h>

http_t      *http;
cups_lang_t *language;
ipp_t       *request;
ipp_t       *response;

...

/* Get the default language */
language = cupsLangDefault();

/* Create a new IPP request */
request = ippNew();
```

See Also

```
request->request.op.operation_id = IPP_PRINT_FILE;
request->request.op.request_id   = 1;

/* Add required attributes */
ippAddString(request, IPP_TAG_OPERATION, IPP_TAG_CHARSET,
    "attributes-charset", NULL, cupsLangEncoding(language));

ippAddString(request, IPP_TAG_OPERATION, IPP_TAG_LANGUAGE,
    "attributes-natural-language", NULL,
    language != NULL ? language->language : "C");

ippAddString(request, IPP_TAG_OPERATION, IPP_TAG_URI, "printer-uri",
    NULL, "ipp://hostname/resource");

ippAddString(request, IPP_TAG_OPERATION, IPP_TAG_NAME, "requesting-user-name",
    NULL, cupsUser());

/* Do the request... */
response = cupsDoFileRequest(http, request, "/resource", "filename.txt");
```

### See Also

[cupsLangDefault\(\)](#), [cupsLangEncoding\(\)](#), [cupsUser\(\)](#), [httpConnect\(\)](#),  
[ippAddString\(\)](#), [ippNew\(\)](#)

# cupsDoRequest()

## Usage

```
ipp_t *
cupsDoRequest(http_t *http,
              ipp_t *request,
              const char *resource);
```

## Arguments

Argument	Description
http	HTTP connection to server.
request	IPP request data.
resource	HTTP resource name for POST.

## Returns

IPP response data or NULL if the request fails. On failure the error can be found by calling [cupsLastError\(\)](#).

## Description

`cupsDoRequest()` does a HTTP POST request and provides the IPP request to the IPP server. It also handles resubmitting the request and performing password authentication as needed.

## Example

```
#include <cups.h>

http_t      *http;
cups_lang_t *language;
ipp_t       *request;
ipp_t       *response;

...

/* Get the default language */
language = cupsLangDefault();

/* Create a new IPP request */
request = ippNew();

request->request.op.operation_id = IPP_GET_PRINTER_ATTRIBUTES;
request->request.op.request_id   = 1;

/* Add required attributes */
```

See Also

```
ippAddString(request, IPP_TAG_OPERATION, IPP_TAG_CHARSET,  
             "attributes-charset", NULL, cupsLangEncoding(language));  
  
ippAddString(request, IPP_TAG_OPERATION, IPP_TAG_LANGUAGE,  
             "attributes-natural-language", NULL,  
             language != NULL ? language->language : "C");  
  
ippAddString(request, IPP_TAG_OPERATION, IPP_TAG_URI, "printer-uri",  
             NULL, "ipp://hostname/resource");  
  
/* Do the request... */  
response = cupsDoRequest(http, request, "/resource");
```

## cupsFreeOptions()

### Usage

```
void
cupsFreeOptions(int num_options,
                cups_option_t *options);
```

### Arguments

Argument	Description
num_options	Number of options in array.
options	Pointer to options array.

### Description

`cupsFreeOptions()` frees all memory associated with the option array specified.

### Example

```
#include <cups/cups.h>

int          num_options;
cups_option_t *options;

...

cupsFreeOptions(num_options, options);
```

### See Also

# cupsGetClasses()

## Usage

```
int
cupsGetClasses(char ***classes);
```

## Arguments

Argument	Description
classes	Pointer to character pointer array.

## Returns

The number of printer classes available.

## Description

`cupsGetClasses()` gets a list of the available printer classes. The returned array should be freed using the `free()` when it is no longer needed.

## Example

```
#include <cups/cups.h>

int i;
int num_classes;
char **classes;

...

num_classes = cupsGetClasses();

...

if (num_classes > 0)
{
    for (i = 0; i < num_classes; i++)
        free(classes[i]);

    free(classes);
}
```

## See Also

## cupsGetDefault()

### Usage

```
const char *  
cupsGetDefault(void);
```

### Returns

A pointer to the default destination.

### Description

`cupsGetDefault()` gets the default destination printer or class. The default destination is stored in a static string and will be overwritten (usually with the same value) after each call.

### Example

```
#include <cups/cups.h>  
  
printf("The default destination is %s\n", cupsGetDefault());
```

### See Also

[`cupsGetClasses\(\)`, `cupsGetPrinters\(\)`](#)

## cupsGetOption()

### Usage

```
const char *
cupsGetOption(const char *name,
              int num_options,
              cups_option_t *options);
```

### Arguments

Argument	Description
name	The name of the option.
num_options	The number of options in the array.
options	The options array.

### Returns

A pointer to the option values or NULL if the option is not defined.

### Description

`cupsGetOption( )` returns the first occurrence of the named option. If the option is not included in the options array then a NULL pointer is returned.

```
#include <cups/cups.h>
```

```
int          num_options;
cups_option_t *options;
const char   *media;
```

```
...
```

```
media = cupsGetOption("media", num_options, options);
```

### See Also

# cupsGetPassword()

## Usage

```
const char *
cupsGetPassword(const char *prompt);
```

## Arguments

Argument	Description
prompt	The prompt to display to the user.

## Returns

A pointer to the password that was entered or NULL if no password was entered.

## Description

`cupsGetPassword( )` displays the prompt string and asks the user for a password. The password text is not echoed to the user.

## Example

```
#include <cups/cups.h>

char *password;

...

password = cupsGetPassword("Please enter a password:");
```

## See Also

# cupsGetPPD()

## Usage

```
const char *
cupsGetPPD(const char *printer);
```

## Arguments

Argument	Description
printer	The name of the printer.

## Returns

The name of a temporary file containing the PPD file or NULL if the printer cannot be located or does not have a PPD file.

## Description

`cupsGetPPD( )` gets a copy of the PPD file for the named printer. The printer name can be of the form "printer" or "printer@hostname".

You should remove (unlink) the PPD file after you are done using it. The filename is stored in a static buffer and will be overwritten with each call to `cupsGetPPD( )`.

## Example

```
#include <cups/cups.h>

char *ppd;

...

ppd = cupsGetPPD("printer@hostname");

...

unlink(ppd);
```

# cupsGetPrinters()

## Usage

```
int
cupsGetPrinters(char ***printers);
```

## Arguments

Argument	Description
printers	Pointer to character pointer array.

## Returns

The number of printer printers available.

## Description

`cupsGetPrinters()` gets a list of the available printers. The returned array should be freed using the `free()` when it is no longer needed.

## Example

```
#include <cups/cups.h>

int i;
int num_printers;
char **printers;

...

num_printers = cupsGetPrinters(;

...

if (num_printers > 0)
{
    for (i = 0; i num_printers; i ++)
        free(printers[i]);

    free(printers);
}
```

## cupsLangDefault()

### Usage

```
const char *  
cupsLangDefault(void);
```

### Returns

A pointer to the default language structure.

### Description

`cupsLangDefault()` returns a language structure for the default language. The default language is defined by the `LANG` environment variable. If the specified language cannot be located then the POSIX (English) locale is used.

Call `cupsLangFree()` to free any memory associated with the language structure when you are done.

### Example

```
#include <cups/language.h>  
  
cups_lang_t *language;  
...  
  
language = cupsLangDefault();  
  
...  
  
cupsLangFree(language);
```

### See Also

# cupsLangEncoding()

## Usage

```
char *
cupsLangEncoding(cups_lang_t *language);
```

## Arguments

Argument	Description
language	The language structure.

## Returns

A pointer to the encoding string.

## Description

`cupsLangEncoding()` returns the language encoding used for the specified language, e.g. "iso-8859-1", "utf-8", etc.

## Example

```
#include <cups/language.h>

cups_lang_t *language;
char        *encoding;
...

language = cupsLangDefault();
encoding = cupsLangEncoding(language);
...

cupsLangFree(language);
```

## See Also

[cupsLangDefault\(\)](#), [cupsLangFlush\(\)](#), [cupsLangFree\(\)](#), [cupsLangGet\(\)](#), [cupsLangString\(\)](#)

# cupsLangFlush()

## Usage

```
void  
cupsLangFlush(void);
```

## Description

`cupsLangFlush( )` frees all language structures that have been allocated.

## Example

```
#include <cups/language.h>  
  
...  
  
cupsLangFlush();
```

## See Also

[cupsLangDefault\(\)](#), [cupsLangEncoding\(\)](#), [cupsLangFree\(\)](#), [cupsLangGet\(\)](#), [cupsLangString\(\)](#)

## cupsLangFree()

### Usage

```
void  
cupsLangFree(cups_lang_t *language);
```

### Arguments

Argument	Description
language	The language structure to free.

### Description

`cupsLangFree()` frees the specified language structure.

### Example

```
#include <cups/language.h>  
  
cups_lang_t *language;  
...  
  
cupsLangFree(language);
```

### See Also

[cupsLangDefault\(\)](#), [cupsLangEncoding\(\)](#), [cupsLangFlush\(\)](#), [cupsLangGet\(\)](#), [cupsLangString\(\)](#)

# cupsLangGet()

## Usage

```
cups_lang_t *
cupsLangGet(const char *name);
```

## Arguments

Argument	Description
name	The name of the locale.

## Returns

A pointer to a language structure.

## Description

`cupsLangGet( )` returns a language structure for the specified locale. If the locale is not defined then the POSIX (English) locale is substituted.

## Example

```
#include <cups/language.h>

cups_lang_t *language;

...

language = cupsLangGet("fr");

...

cupsLangFree(language);
```

## See Also

[cupsLangDefault\(\)](#), [cupsLangEncoding\(\)](#), [cupsLangFlush\(\)](#), [cupsLangFree\(\)](#), [cupsLangString\(\)](#)

# cupsLangString()

## Usage

```
char *
cupsLangString(cups_lang_t *language,
               int          message);
```

## Arguments

Argument	Description
language	The language to query.
message	The message number.

## Returns

A pointer to the message string or NULL if the message is not defined.

## Description

`cupsLangString()` returns a pointer to the specified message string in the specified language.

## Example

```
#include <cups/language.h>

cups_lang_t *language;
char          *s;
...

language = cupsLangGet("fr");

s = cupsLangString(language, CUPS_MSG_YES);

...

cupsLangFree(language);
```

## See Also

## cupsLastError()

### Usage

```
ipp_status_t  
cupsLastError(void);
```

### Returns

An enumeration containing the last IPP error.

### Description

`cupsLastError( )` returns the last IPP error that occurred. If no error occurred then it will return `IPP_OK` or `IPP_OK_CONFLICT`.

### Example

```
#include <cups/cups.h>  
  
ipp_status_t status;  
  
...  
  
status = cupsLastError();
```

### See Also

[cupsCancelJob\(\)](#), [cupsPrintFile\(\)](#)

# cupsMarkOptions()

## Usage

```
int
cupsMarkOptions(ppd_file_t *ppd,
                int num_options,
                cups_option_t *options);
```

## Arguments

Argument	Description
ppd	The PPD file to mark.
num_options	The number of options in the options array.
options	A pointer to the options array.

## Returns

The number of conflicts found.

## Description

`cupsMarkOptions()` marks options in the PPD file. It also handles mapping of IPP option names and values to PPD option names.

## Example

```
#include <cups/cups.h>

int          num_options;
cups_option_t *options;
ppd_file_t   *ppd;

...

cupsMarkOptions(ppd, num_options, options);
```

## See Also

[cupsAddOption\(\)](#), [cupsFreeOptions\(\)](#), [cupsGetOption\(\)](#), [cupsParseOptions\(\)](#)

# cupsParseOptions()

## Usage

```
int
cupsParseOptions(const char *arg,
                 int num_options,
                 cups_option_t **options);
```

## Arguments

Argument	Description
arg	The string containing one or more options.
num_options	The number of options in the options array.
options	A pointer to the options array pointer.

## Returns

The new number of options in the array.

## Description

`cupsParseOptions()` parses the specifies string for one or more options of the form "name=value", "name", or "noname". It can be called multiple times to combine the options from several strings.

## Example

```
#include <cups/cups.h>

int          num_options;
cups_option_t *options;

...

num_options = 0;
options     = (cups_option_t *)0;
num_options = cupsParseOptions(argv[5], num_options, &options);
```

## See Also

[cupsAddOption\(\)](#), [cupsFreeOptions\(\)](#), [cupsGetOption\(\)](#), [cupsMarkOptions\(\)](#)

# cupsPrintFile()

## Usage

```
int
cupsPrintFile(const char *printer,
              const char *filename,
              const char *title,
              int num_options,
              cups_option_t *options);
```

## Arguments

Argument	Description
printer	The printer or class to print to.
filename	The file to print.
title	The job title.
num_options	The number of options in the options array.
options	A pointer to the options array.

## Returns

The new job ID number or 0 on error.

## Description

`cupsPrintFile()` sends a file to the specified printer or class for printing. If the job cannot be printed the error code can be found by calling `cupsLastError()`.

## Example

```
#include <cups/cups.h>

int          num_options;
cups_option_t *options;

...

cupsPrintFile("printer@hostname", "filename.ps", "Job Title", num_options,
              options);
```

## See Also

[cupsCancelJob\(\)](#), [cupsLastError\(\)](#)

## cupsRasterClose()

### Usage

```
void
cupsRasterClose(cups_raster_t *ras);
```

### Arguments

Argument	Description
ras	The raster stream to close.

### Description

`cupsRasterClose()` closes the specified raster stream.

### Example

```
#include <cups/raster.h>

cups_raster_t *ras;

...

cupsRasterClose(ras);
```

### See Also

[cupsRasterOpen\(\)](#), [cupsRasterReadHeader\(\)](#), [cupsRasterReadPixels\(\)](#), [cupsRasterWriteHeader\(\)](#), [cupsRasterWritePixels\(\)](#)

# cupsRasterOpen()

## Usage

```
cups_raster_t *
cupsRasterOpen(int fd,
               cups_mode_t mode);
```

## Arguments

Argument	Description
fd	The file descriptor to use.
mode	The mode to use; CUPS_RASTER_READ or CUPS_RASTER_WRITE.

## Returns

A pointer to a raster stream or NULL if there was an error.

## Description

cupsRasterOpen( ) opens a raster stream for reading or writing.

## Example

```
#include <cups/raster.h>

cups_raster_t *ras;

...

ras = cupsRasterOpen(0, CUPS_RASTER_READ);
```

## See Also

[cupsRasterClose\(\)](#), [cupsRasterReadHeader\(\)](#), [cupsRasterReadPixels\(\)](#), [cupsRasterWriteHeader\(\)](#), [cupsRasterWritePixels\(\)](#)

# cupsRasterReadHeader()

## Usage

```
unsigned
cupsRasterReadHeader(cups_raster_t *ras,
                    cups_page_header_t *header);
```

## Arguments

Argument	Description
ras	The raster stream to read from.
header	A pointer to a page header structure to read into.

## Returns

1 on success, 0 on EOF or error.

## Description

`cupsRasterReadHeader()` reads a page header from the specified raster stream.

## Example

```
#include <cups/raster.h>

int          line;
cups_raster_t *ras;
cups_raster_header_t header;
unsigned char pixels[8192];
...

while (cupsRasterReadHeader(ras, &header))
{
    ...

    for (line = 0; line < header.cupsHeight; line++)
    {
        cupsRasterReadPixels(ras, pixels, header.cupsBytesPerLine);

        ...
    }
}
```

## See Also

[cupsRasterClose\(\)](#), [cupsRasterOpen\(\)](#), [cupsRasterReadPixels\(\)](#), [cupsRasterWriteHeader\(\)](#),  
[cupsRasterWritePixels\(\)](#)

## cupsRasterReadPixels()

### Usage

```
unsigned
cupsRasterReadPixels(cups_raster_t *ras,
                    unsigned char *pixels,
                    unsigned length);
```

### Arguments

Argument	Description
ras	The raster stream to read from.
pixels	The pointer to a pixel buffer.
length	The number of bytes of pixel data to read.

### Returns

The number of bytes read or 0 on EOF or error.

### Description

`cupsRasterReadPixels()` reads pixel data from the specified raster stream.

### Example

```
#include <cups/raster.h>

int          line;
cups_raster_t *ras;
cups_raster_header_t header;
unsigned char pixels[8192];
...

while (cupsRasterReadHeader(ras, &header))
{
    ...

    for (line = 0; line < header.cupsHeight; line++)
    {
        cupsRasterReadPixels(ras, pixels, header.cupsBytesPerLine);

        ...
    }
}
```

## See Also

[cupsRasterClose\(\)](#), [cupsRasterOpen\(\)](#), [cupsRasterReadHeader\(\)](#), [cupsRasterWriteHeader\(\)](#),  
[cupsRasterWritePixels\(\)](#)

# cupsRasterWriteHeader()

## Usage

```
unsigned
cupsRasterWriteHeader(cups_raster_t *ras,
                     cups_page_header_t *header);
```

## Arguments

Argument	Description
ras	The raster stream to write to.
header	A pointer to the page header to write.

## Returns

1 on success, 0 on error.

## Description

`cupsRasterWriteHeader()` writes the specified page header to a raster stream.

## Example

```
#include <cups/raster.h>

int          line;
cups_raster_t *ras;
cups_raster_header_t header;
unsigned char pixels[8192];
...

cupsRasterWriteHeader(ras, &header);

for (line = 0; line < header.cupsHeight; line++)
{
    ...

    cupsRasterWritePixels(ras, pixels, header.cupsBytesPerLine);
}
```

## See Also

[cupsRasterClose\(\)](#), [cupsRasterOpen\(\)](#), [cupsRasterReadHeader\(\)](#), [cupsRasterReadPixels\(\)](#), [cupsRasterWritePixels\(\)](#)

# cupsRasterWritePixels()

## Usage

```
unsigned
cupsRasterWritePixels(cups_raster_t *ras,
                     unsigned char *pixels,
                     unsigned length);
```

## Arguments

Argument	Description
ras	The raster stream to write to.
pixels	The pixel data to write.
length	The number of bytes to write.

## Returns

The number of bytes written.

## Description

`cupsRasterWritePixels()` writes the specified pixel data to a raster stream.

## Example

```
#include <cups/raster.h>

int          line;
cups_raster_t *ras;
cups_raster_header_t header;
unsigned char pixels[8192];
...

cupsRasterWriteHeader(ras, &header);

for (line = 0; line < header.cupsHeight; line++)
{
    ...

    cupsRasterWritePixels(ras, pixels, header.cupsBytesPerLine);
}
```

# cupsServer()

## Usage

```
const char *  
cupsServer(void);
```

## Returns

A pointer to the default server name.

## Description

`cupsServer( )` returns a pointer to the default server name. The server name is stored in a static location and will be overwritten with every call to `cupsServer( )`

The default server is determined from the following locations:

1. The CUPS\_SERVER environment variable,
2. The ServerName directive in the *cupsd.conf* file,
3. The default host, "localhost".

## Example

```
#include <cups/cups.h>  
  
const char *server;  
  
server = cupsServer();
```

## See Also

[cupsGetPassword\(\)](#), [cupsUser\(\)](#)

# cupsTempFile()

## Usage

```
char *
cupsTempFile(char *filename,
             int length);
```

## Arguments

Argument	Description
filename	The character string to hold the temporary filename.
length	The size of the filename string in bytes.

## Returns

A pointer to filename.

## Description

cupsTempFile() generates a temporary filename for the */var/tmp* directory or the directory specified by the TMPDIR environment variable.

## Example

```
#include <cups/cups.h>

char filename[256];

cupsTempFile(filename, sizeof(filename));
```

## cupsUser()

### Usage

```
const char *  
cupsUser(void);
```

### Returns

A pointer to the current username or NULL if the user ID is undefined.

### Description

`cupsUser()` returns the name associated with the current user ID as reported by the `getuid()` system call.

### Example

```
#include <cups/cups.h>  
  
const char *user;  
  
user = cupsUser();
```

## ippDelete()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ippFindAttribute()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ippLength()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ippNew()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ippPort()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ippRead()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ippTimeToDate()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ippWrite()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## mimeAddFilter()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## mimeAddType()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## mimeAddTypeRule()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## mimeDelete()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## mimeFileType()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## mimeFilter()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## mimeLoad()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## mimeMerge()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## mimeNew()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## mimeType()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdClose()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdConflicts()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## pddEmitFd()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdEmit()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdFindMarkedChoice()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdFindOption()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdIsMarked()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdMarkDefaults()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdMarkOption()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdOpenFd()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdOpenFile()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdOpen()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdPageLength()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdPageSize()

### Usage

### Arguments

Argument	Description

### Returns

### Description

### Example

### See Also

## ppdPageWidth()

### Usage

### Arguments

Argument	Description

### Returns
